

What's New

1

Dedupe to Cloud

Backup Exec 16 FP2 introduces deduplication to cloud which means only unique chunks of data are stored in the cloud.

Data deduplication to cloud shrinks backup storage requirements in the cloud by up to 90% and cut network use with intelligent deduplication resulting in faster and efficient backups.

Supported cloud providers include Amazon Web Services (AWS), Microsoft Azure, Google Cloud and standard S3-compatible cloud.

2

NEW! Veritas Backup Exec™ CloudConnect Optimizer (CCO)

The new Veritas Backup Exec™ CloudConnect Optimizer automatically detects and corrects variations in the "Write Connections" setting so backups better utilize available network bandwidth.

This ensures successful backups and improved data rates based on the network bandwidth.

3

S3 compatible cloud storage

Backup Exec broadens cloud storage through the S3 provider enabling greater flexibility to users. You can now configure any S3 compatible cloud storage devices with Backup Exec.

This new feature meets the standard for "advanced" S3 compatibility, which allows administrators to deploy hybrid cloud storage that works natively with the S3 SDK.

Targeted for organizations looking at secure cloud storage for backup and recovery as easily as on-premise storage, but with lower costs

Allows customers to target backups to their own S3 compatible cloud storage devices

Simple-to-deploy solution and does NOT require any additional license

Backup Exec automatically deletes expired backup sets just like any other disk storage

4

Expanded Cloud Coverage

With this release, Backup Exec users benefit from extended cloud storage choices through support for the following cloud storage regions, enabling greater flexibility and economy:

✓ Microsoft Azure Government Cloud

✓ Microsoft Azure Germany

Also, this release improves accessibility of cloud storage data with support of the Regional storage class for Google cloud storage.

5

Making it easier to upgrade with Backup Exec Migration Assistant

The new Veritas Backup Exec™ Migration Assistant lets you migrate your data from one Backup Exec server (source) to another Backup Exec server (destination).

If you are still using Backup Exec 2010 and would like to upgrade to Backup Exec 16 FP2, you can use the Backup Exec Migration Assistant to move the database, catalogs and media from a Backup Exec 2010 server to another server that is running a new installation of Backup Exec 16.
